2. Overview

This test plan describes how to test the Transport API part of the Open Mobile API. This is the mandatory part of the Open Mobile API. The other parts of the Open Mobile API shall be tested in a similar way.
3. Class SEService

The SEService realizes the communication to available Secure Elements on the device. This is the entry point of this API. It is used to connect to the infrastructure and get access to a list of Secure Element Readers.

3.1 Method: Reader[] getReaders()

3.1.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

```java
Reader[] getReaders()
```

Normal execution

- CRN1: Reader[] contains the list of available secure element readers.
- CRN2: If there is no reader, then the array of readers returned by getReaders() method has length 0
- CRN3: There must be no duplicated objects in the list of readers

Parameter errors

None

Context errors

None

3.2 Method: boolean isConnected()

3.2.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

```java
boolean isConnected()
```

Normal execution

- CRN1: isConnected() returns true if the service is connected
- CRN2: isConnected() returns false if the service is not connected

Parameter errors

None

Context errors

None

3.3 Method: void shutdown()

3.3.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

```java
void shutdown()
```

Normal execution

- CRN1: Releases all Secure Elements resources allocated by this SEService.

---

1 CRN stands for Conformance Requirement Number
3.4 Constructor: SEService(Context context, SEService.CallBack listener)

3.4.1 Conformance Requirements
The constructor with the following header shall be compliant to its definition in the API.

SEService(Context context, SEService.CallBack listener)

Normal execution
CRN1: Establishes a new connection that can be used to connect to all the Secure Elements available in the system.
CRN2: The isConnected() method of the specified listener is called if the connection process is finished.
CRN3: The serviceConnected() method returns true if the connection process is finished.

Parameter errors
IllegalParameterError – if the parameter context is null.

Context errors
None
4. **Class (or interface): SEService.CallBack**

Interface to receive call-backs when the service is connected.
If the target language and environment allows it, then this shall be an inner interface of the SEService class.

4.1 **Method: void serviceConnected(SEService service)**

4.1.1 **Conformance Requirements**

The method with the following header shall be compliant to its definition in the API.

```java
void serviceConnected(SEService service)
```

**Normal execution**

CRN1: The framework calls this method when the service is connected. The SEService object parameter must be the object that was created as result of the SEService constructor and must not be null.

**Parameter errors**

None

**Context errors**

None
5. Class: Reader

Instances of this class represent Secure Element Readers connected to this device. These Readers can be physical devices or virtual devices. They can be removable or not. They can contain one Secure Element that can or cannot be removed.

5.1 Method: String getName()

5.1.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

```java
String getName()
```

Normal execution

CRN1: this method returns the user-friendly name of this reader.
CRN2: If a reader is a SIM reader, then its name must start with the "SIM" prefix.
CRN3: If a reader is a SD or micro SD reader, then its name must start with the "SD" prefix.
CRN4: If a reader is an embedded SE reader, then its name must start with the "eSE" prefix.

Parameter errors

None

Context errors

None

5.2 Method SEService getSEService()

5.2.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

```java
SEService getSEService()
```

Normal execution

CRN1: Return the service this reader is bound to.

Parameter errors

None

Context errors

None

5.3 Method: boolean isSecureElementPresent()

5.3.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

```java
boolean isSecureElementPresent()
```

Normal execution

CRN1: Checks if a secure element is present in the selected reader. If so, then the method returns true.
CRN2: Checks if a secure element is present in the selected reader. If not, then the method returns false.
Parameter errors
None

Context errors
None

5.4 Method: Session openSession()

5.4.1 Conformance Requirements
The method with the following header shall be compliant to its definition in the API.
Session openSession()

Normal execution
CRN1: this method allows a developer to connect to a secure element in the reader
CRN2: the Secure Element needs to be prepared (initialized) for communication (i.e. switched on)

Parameter errors
None

Context errors
IOError - if something went wrong when communicating with the Secure Element or the reader.

5.5 Method: void closeSessions()

5.5.1 Conformance Requirements
The method with the following header shall be compliant to its definition in the API.
void closeSession()

Normal execution
CRN1: Close all the sessions opened on this reader.
CRN2: All the channels opened by all this session will be closed.

Parameter errors
None

Context errors
None
6. Class: Session

Instances of this class represent a connection session to one of the secure elements available on the device. These objects can be used to get a communication channel with an application in the secure element. This channel can be the basic channel or a logical channel.

6.1 Method: Reader getReader()

6.1.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

Reader getReader()

Normal execution

CRN1: Get the reader that provides this session.

Parameter errors
None

Context errors
None

6.2 Method: byte[] getATR()

6.2.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

byte[] getATR()

Normal execution

CRN1: this method gets the Answer to Reset of this secure element.
CRN2: if the ATR for this secure element is not available the returned byte array is null

Parameter errors
None

Context errors
None

6.3 Method: void close()

6.3.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

void close()

Normal execution

CRN1: Close the connection with the secure element.
CRN2: This API will close any channels opened by this application with this secure element.

Parameter errors
None

Context errors
None
6.4 **Method: boolean isClosed()**

6.4.1 **Conformance Requirements**
The method with the following header shall be compliant to its definition in the API.

```
boolean isClosed()
```

**Normal execution**

- **CRN1:** Tells if this session is closed: if so, isClosed returns “true”
- **CRN2:** If the session is open it returns false

**Parameter errors**

None

**Context errors**

None

6.5 **Method: void closeChannels()**

6.5.1 **Conformance Requirements**
The method with the following header shall be compliant to its definition in the API.

```
void closeChannels()
```

**Normal execution**

- **CRN1:** Close any channel opened on this session.

**Parameter errors**

None

**Context errors**

None

6.6 **Method: Channel openBasicChannel(byte[] aid)**

6.6.1 **Conformance Requirements**
The method with the following header shall be compliant to its definition in the API.

```
Channel openBasicChannel(byte[] aid)
```

**Normal execution**

- **CRN1:** Get an access to the basic channel, as defined in the ISO7816-4 specification (the one that has number 0). The obtained object is an instance of the Channel class.
- **CRN2:** The AID can be null, which means no SE application is to be selected on this channel and the default SE application is used. If the default SE is not currently selected on the basic channel then null will be returned.
- **CRN3:** Once this channel has been opened by a device application, it is considered as "locked" by this device application, and other calls to this method will return null, until the channel is closed.
- **CRN4:** Returns null if the basic channel is locked (e.g. by the Secure Element or Secure Element drivers).

**Parameter errors**

- **IllegalArgumentException** - if the aid's length is not within 5 to 16 (inclusive).
Context errors
- IOException - if something goes wrong with the communication to the reader or the secure element.
- IllegalStateException - if the secure element session is used after being closed.
- SecurityError - if the calling application cannot be granted access to this AID on this session.

6.7 Method: Channel openLogicalChannel(byte[] aid)

6.7.1 Conformance Requirements
The method with the following header shall be compliant to its definition in the API.
Channel openLogicalChannel(byte[] aid)

Normal execution
- CRN1: Open a logical channel with the secure element, selecting the application represented by the given AID.
- CRN2: if the AID is null, then the default application shall be used.
- CRN3: It's up to the secure element to choose which logical channel will be used.
- CRN4: return null if secure element is unable to provide a new logical channel

Parameter errors
- IllegalArgumentException - if the aid's length is not within 5 to 16 (inclusive).

Context errors
- IOException - if something goes wrong with the communication to the reader or the secure element. (e.g. if the AID is not available)
- IllegalStateException - if the secure element session is used after being closed.
- SecurityError - if the calling application cannot be granted access to this AID on this session.
7. Class: Channel

Instances of this class represent an ISO7816-4 channel opened to a secure element. It can be either a logical channel or the default channel. They can be used to send APDUs to the secure element. Channels are opened by calling the Session.openBasicChannel(byte[]) or Session.openLogicalChannel(byte[]) methods.

7.1 Method: void close()

7.1.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

void close()

Normal execution

CRN1: the close() method closes the channel to the secure element
CRN2: if the channel is the basic channel, then it becomes available again
CRN3: if the channel is already closed, the method is ignored
CRN4: The close() method shall wait for completion of any pending transmit(byte[] command) before closing the channel.

Parameter errors

None

Context errors

None

7.2 Method: boolean isBasicChannel()

7.2.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean isBasicChannel()

Normal execution

CRN1: this method returns true if the channel is the basic channel
CRN2: this method returns false if the channel is a logical channel

Parameter errors

None

Context errors

None

7.3 Method: boolean isClosed()

7.3.1 Conformance Requirements

The method with the following header shall be compliant to its definition in the API.

boolean isOpened ()

Normal execution

CRN1: this method returns true if the channel is closed
CRN2: this method returns false if the channel is open
7.4 Method: byte[] getSelectResponse()

7.4.1 Conformance Requirements
The method with the following header shall be compliant to its definition in the API.
byte[] getSelectResponse()

Normal execution
CRN1: Returns the data as received from the application select command inclusively the status word.
CRN2: The returned byte array contains the data bytes in the following order:
    [<first data byte>, ..., <last data byte>, <sw1>, <sw2>]
CRN3: The returned byte array contains only the status word if the application select command has no data returned.
CRN4: Null is returned if the application select command has not been performed or the selection response can not be retrieved by the reader implementation.

Parameter errors
None

Context errors
None

7.5 Method: Session getSession()

7.5.1 Conformance Requirements
The method with the following header shall be compliant to its definition in the API.
Session getSession()

Normal execution
CRN1: this method returns the session object this channel is bound to

Parameter errors
None

Context errors
None

7.6 Method: byte[] transmit(byte[] command)

7.6.1 Conformance Requirements
The method with the following header shall be compliant to its definition in the API.
byte[] transmit(byte[] command)
Normal execution
CRN1: Transmit an APDU command as per ISO7816-4 to the secure element. The underlying layers can generate as many TPDUs as necessary to transport this APDU. The transport part is invisible from the application.
CRN2: The system ensures the synchronization between all the concurrent calls to this method. The entire APDU communication to this SE is locked to the APDU.
CRN3: The system ensures that only one APDU will be sent at a time, irrespective of the number of TPDUs that might be required to transport it to the SE.
CRN4: The channel information in the class byte in the APDU will be ignored: the system will add any required information to ensure the APDU is transported on this channel.

Parameter errors
IllegalParameterError – if the parameter command is null.
IllegalParameterError – if a MANAGE_CHANNEL command is sent to the SE
IllegalParameterError – if a SELECT by DF Name (p1=04) command is sent to the SE

Context errors
IOException – if there is a communication problem to the reader or the Secure Element.
IllegalStateException – if the channel is closed at the time of invocation of this method
IllegalParameterError – if the command byte array is less than 4 bytes long
IllegalParameterError – if the length of the APDU is not coherent with the length of the command byte array
SecurityError – if the command is filtered by the security policy.
